Isolated barriers provide an AC detection voltage to the electrode sensor. When the conductive medium contacts the electrode, an AC will be generated in the input measurement loop. The change of the AC signal detected will be transmitted to the Safe area via the isolated barrier and will output via relay contacts. This product has the Line Fault (breakage) Detection function. If we select the LFD, output2 will output alarm signal. If we do not select LFD, output2 and output1 will output same signal.

Note: 1、The “%” of conversion accuracy is relative to its range. Take the larger value between the range error and the absolute error when applying.
2、Allow a maximum wire resistance of 50Ω/line for RTD input(3-wire).
3、When the thermocouple is input, the conversion accuracy does not include the CJC. For every 100Ω increase in the compensation wire, the cold junction error increases by 0.2°C.
4、When the Type B thermocouple is input, the temperature range is required to be greater than 680 °C to ensure the accuracy index.
5、mV signal input needs to be customized.

Configuration Accessory

Component:

- 1、DIN 35mm rail
- 2、Female plug
- 3、Bus connector
- 4、Male plug
- 5、Isolated barrier

Instruction for Use:

1. Each isolated barrier is matched with a bus connector. The connectors can be spliced together. It is recommended to connect 8-16 connectors in a group.
2. A male plug and a female plug are required at the head and tail of each group of connectors.
3. The wire used in the bus power supply module has a length of about 8 mm for the ferrules or exposed wire. The exposed wires or ferrules should be fixed by M2 screws in the plug.
4. Bus connector has a pluggable error-proof function. Pay attention to the direction of the error-proof slot on the barrier housing when installing the isolated barrier to the bus connector.
